Weekly incident summary

18 January 2017

Note: While the majority of incidents are reported and recorded within a week of the event, some are notified outside this time period. The incidents in this report therefore have not necessarily occurred in a one week period. All newly recorded incidents, whatever the incident date, are reviewed by the Chief Inspector and senior staff each week. For more comprehensive statistical data refer to our Annual Performance Measures Reports.

To report an incident call 1300 814 609 24 hours a day, 7 days a week

Reportable incidents total: 19    Summarised incidents: 3

Summarised incidents – incidents of note for which operators should consider the comments provided and determine if action needs to be taken.

| Dangerous incident  | A stand-alone battery was being used to jump start a water pump. When an attempt was made to crank the pump the stand-alone battery exploded. The worker was approximately 4 m from the battery and was not injured or affected by the exploding battery. | This incident is still under investigation, but initial observation highlights the risks associated with the use of lead acid batteries. The battery involved in this incident appears to have been removed from service in its original application. When a battery is removed from service due to inability to perform its intended function, it should be considered unserviceable and disposed of, in accordance with original equipment manufacturer recommendations. It should not be reassigned to alternative uses. Reference should be made to following safety alerts for further information relating to battery explosions:  
  • NSW Department of Industry – Mine Safety, safety bulletin: SB16-02 Exploding lead acid batteries  
  • QLD Dept of Natural Resources and Mines: Safety Bulletin no.150 Exploding lead acid batteries  
  • Worksafe Victoria: Safety Alert Preventing battery explosions |
| SlnNot 2017/00047   |                                                                                                                                                                                                         |                                                                                                                                                                                                                       |
| Dangerous incident  | While dewatering the gas drainage line in a development panel, an operator isolated the gas riser. This resulted in the gas range pressurising. The resulting increase in pressure resulted in a 150 mm hose separating at a joint. This released a large | Mine operators should ensure that:  
  • their gas drainage system is designed to accommodate the anticipated peak pressures  
  • all hose fittings are design-rated for the anticipated peak pressures                                                                                                     |
| SlnNot 2016/00192   |                                                                                                                                                                                                         |                                                                                                                                                                                                                       |

volume of CO2 inbye. | • isolation procedures are in place that minimise the potential for the gas drainage line to pressurise.

**Dangerous incident**

SInNot-2017/00035

After completing a task, an operator was docking the overhead crane in the coal handling and preparation plan. As he was docking the crane, a bracket fell from the crane to the deck beside him. The bracket was approximately 5 kg and possibly broke away due to fatigue.

Mine operators are reminded that regular inspection and, where appropriate, non-destructive testing should be carried out as part of the maintenance and certification cycle for plant. Where any modification is made to the plant, change management procedures should be used to ensure that the modification is captured in the maintenance and inspection schedule.

Mine operators should also consider the environment in which the plant is to be operated and adjust those timeframes accordingly.
