REPORTABLE INCIDENTS | WHS MINES LEGISLATION

Weekly incident summary

18 May 2016

Note: While the majority of incidents are reported and recorded within a week of the event, some are notified outside this time period. The incidents in this report therefore have not necessarily occurred in a one week period. All newly recorded incidents, whatever the incident date, are reviewed by the Chief Inspector and senior staff each week and summarised in this report. For more comprehensive statistical data refer to our Annual Performance Measures Reports.

Reportable incidents overview

Note: While all incidents are investigated, generally only level 2 and 3 incidents are summarised below.

<table>
<thead>
<tr>
<th>Level</th>
<th>Incident type</th>
<th>Summary</th>
<th>Comment to industry</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Explosives</td>
<td>A 400g booster was lost down a hole whilst blast crew were carrying out loading activity. Shot firer identified that there was one less booster than downline detonators.</td>
<td>Mines should ensure security of explosives conform to the Explosives Act 2003 and Explosives Regulation 2013. Shotfirsers must have direct control over the explosives and they must keep adequate records.</td>
</tr>
<tr>
<td></td>
<td>Mobile</td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>Mechanical Equipment</td>
<td>A miner was standing underneath the hopper of a blower attempting to close the door when the dirt fell out and landed on him. The miner suffered a fracture of the vertebral column.</td>
<td>Where there is potential for material to fall from a height and result in injury, the area should be classified as a danger zone and appropriate guards and warning signs must be provided. Workers should be trained and competent in the use of blower extraction systems and the equipment should be fit-for-purpose.</td>
</tr>
<tr>
<td></td>
<td>Mobile</td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>Electrical Energy</td>
<td>An electrician undertaking inspections discovered an 11kV high tension (HT) plug with evidence of having been struck by a vehicle. The HT cable was in a cut-through and there was further evidence that the damaged plug was re-hung. The damage was not reported as required.</td>
<td>Electrical equipment and cables need to be physically protected in areas such as cut-throughs where vehicles are permitted to shunt and/or park. Mine employees should be reminded of the need to report such damage and be made aware of the inherent hazards in handling energised HT cables.</td>
</tr>
</tbody>
</table>
A small localised ground failure from an open cut high-wall occurred during night shift. Rocks from the failure fell onto the access ramp. No personnel were in the open cut at time of failure. The open cut had been closed prior to failure due to the rainfall TARP being implemented at start of night shift. The failure was observed by geotechnical personnel doing a pre-shift inspection for the start of day shift. The area was cordoned off and further geotechnical assistance sought.

The mechanisms for all slope failures should be investigated and established by competent personnel. Back analyses of the failures should be compared with mine design criteria, and actual construction, and corrective actions implemented if similar future failures could present a health and safety risk to personnel.

Recent incident publications

No recent incident publications

You can find all our incident related publications (i.e. safety alerts, safety bulletins, incident information releases, weekly incident summaries and investigation reports) on our website.

Further information
