<td>Dangerous incident SinNot-2018/01312</td>
<td>An underground coal mine operator identified indicators of spontaneous combustion in the goaf of a longwall panel. The mine has recently completed extraction in the panel and is in the process of relocating equipment to the next block. The mine has responded according to their trigger action response plan.</td>
<td>Mines must consider all ventilation variables when monitoring and managing the risk of spon com. This includes changes in longwall ventilation due to goaf falls, roadway choking and seal strata deterioration. Composition of geological structure (e.g. presence of sulphur) needs to be reviewed when assessing the spon com risk.</td>
</tr>
<tr>
<td>Dangerous incident SinNot-2018/01303</td>
<td>A supervisor was sprayed with hydraulic oil from a load haul dump manifold block and transported to hospital where he was cleared of injury. The supervisor was assisting another worker identify the source of an oil leak. When the hydraulics were activated, the oil escaped from a threaded fitting on the manifold block.</td>
<td>The circumstances around this incident are similar to those detailed in SB13-01 Fluid injections result in surgery. This bulletin should be reviewed to confirm the recommendations have been reviewed and actioned.</td>

### Serious injury
SinNot-2018/01297

A worker suffered lacerations, bruising and an injured jaw when he was hit by falling grout tubes. Three workers were installing tubes into a cavity in the roof and when adjusting the alignment of the installed tubes, a joint separated dropping the tubes, hitting one worker on the jaw and chest. An investigation identified that no risk management had taken place for the task.

Mines must have in place systems that require appropriate risk management tools to be available for use by workers for tasks. Additionally, supervision arrangements must include checks to ensure risk management tools are in place.

### Dangerous incident
SinNot-2018/01295

A light vehicle rolled onto its roof while travelling on the surface of an underground coal mine. The driver had previously stopped the vehicle to engage the four-wheel drive function.

Roads should be designed and maintained for all weather conditions. Relying on instructing workers to “drive to the conditions” is a lower order control. The Work Health and Safety Regulation 2011 clause 36 hierarchy of control measures requires the use of substitution, isolation or engineering controls before accepting administrative controls.

### Serious injury
SinNot-2018/01290

A haul truck driver was admitted to hospital with neck pain after the truck was loaded. The incident was not immediately reported.

The Work Health and Safety (Mines and Petroleum Sites) Regulation 2014 clause 178 Serious injury or illness part (a) requires the immediate treatment as an in-patient as a serious injury requiring immediate notification.

The Notification of incident and injury guide provides more detailed information on the types of WHS incidents that must be notified.

| MinEx NZ                           | **Safety device failures found during checks**  
A company has recently experienced several failures of safety devices, which included the following; Stop pull cord control boxes not resetting, Stop pull cords breaking, Alarms and beacons not working, Isolator boxes breaking.  
Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Repco in MinEx NZ                  | **Repco product recall**  
The main column of the Repco 6000 kg vehicle support stands may fracture rather than bend if a load is dropped on its outer edge. If the column fractures the load may fall causing serious injury or death  
Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| MinEx NZ                           | **Unauthorised entry into quarries**  
Recently we have noticed an increase in near-miss events where members of the public have accessed a site during the workday either by deliberately by-passing the office, or driving onto adjacent private land to access a specific part of the site.  
Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| National (other, non-fatal)        | **Worker Crushed by slewing crane**  
In May 2018, a dogger received serious crush injuries while working on a truck mounted crane. He was packing up the chains of the 60-tonne mobile crane when it slewed, trapping him between the counterweights and a toolbox mounted on the truck. Investigations are continuing.  
Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| QLD Mines Dept. In MinEX NZ        | **Serious injuries with plant and persons falling over edges**  
In June 2018 on a surface coal mine, a D11 Dozer travelled over the crest of a highwall while ripping after dark, falling approximately 16 metres onto a lower bench (see Fig.1 below). The dozer also rolled 360 degrees before coming to rest, and the dozer operator was seriously injured. Approximately twelve months prior to this, an identical incident occurred at another surface coal mine. This time during daylight, a D11 Dozer travelled...  
Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
Over the crest of a highwall while ripping, coming to rest about 10 metres below (see Fig.2). In both cases only good fortune prevented a fatality. Details

**Note:** While the majority of incidents are reported and recorded within a week of the event, some are notified outside this time period. The incidents in this report therefore have not necessarily occurred in a one week period. All newly recorded incidents, whatever the incident date, are reviewed by the Chief Inspector and senior staff each week. For more comprehensive statistical data refer to our annual performance measures reports.
